SUPPLEMENTARY INFORMATION

Table S1. Characterization of the sampling sites belonging to dammed and undammed system (Bomfim et al., 2017). *Caracterização dos locais de amostragem pertencentes ao sistema barrado e não barrado (Bomfim et al., 2017)*.

Environments	Caracterização ambiental
Paraná River	(22° 62'S; 53° 15'W): an extension of 230 km downstream of the reservoir of Porto Primavera.
Osmar Lake	(22°40S; 53°10'W): located on an island in the Paraná River, and does not have a connection with the main channel of the river, except during great floods. In addition, this lagoon is considered to be very shallow, with a minimum depth of 0.6 m during drought and maximum depth of 4.5 m during flooding.
Garças Lake	(22° 79'S; 53° 24'W): located on the Paraná River, with a length of 2.1 km, an average depth of 2.0 m, an area of 150 m ² and a perimeter of 5 km.
Ivinhema River	(22° 59'S; 53° 39'W): a tributary of the right bank of the Paraná River, presents a 22/1 length / width ratio and a current velocity of approximately 0.85 m.s ⁻¹ and a mean depth of 3.9 m.
Patos Lake	(22°43'12"S; 53°17'37"W): lake permanently connected by a canal on the left bank of the river Ivinhema. It is a small lake (1.14 km ²) with maximum depth between 2.8 and 4.8m.
Ventura Lake	(22°51'S; 53°36'W): located on the left bank of the lower Ivinhema River, has a length of 2,084.82m, an area of 89.8ha and an average depth of 2.5m.

Table S2. Species list identified in the undammed (IVI= Ivinhema river, VEN= Ventura lake and PAT= Patos lake) and dammed (PAR=Parana river , GAR= Garças lake and OSM= Osmar lake) systems of the high Paraná River floodplain. *Inventário das espécies identificadas nos não barrado (IVI=rio Ivinhema, VEN=lagoa ventura, PAT=lagoa dos patos) e barrado (PAR=rio Paraná, OSM= Lagoa Osmar, GAR= lagoa das Garças) da planície de inundação do alto rio Paraná.*
